HR Attrition Analysis

Four types of analysis and key insights

Four Types of Analysis

Type	Explanation
1. Descriptive What happened?	Summarises past data using totals, counts and percentages. Example: attrition rate for each department.
2. Diagnostic Why did it happen?	Compares groups to find the reasons behind a result. Example: attrition for overtime vs non-overtime employees.
3. Predictive What may happen?	Uses past patterns to estimate which groups are likely to leave. Example: highest-risk groups by tenure and income band.
4. Prescriptive What should we do?	Recommends actions based on the findings. Example: list current high-risk employees and plan retention steps.

Key Insights

- **Overall attrition is 16.1%:** 237 of 1,470 employees left.
- **Overtime doubles the risk:** 30.5% of overtime employees left, against 10.4% of others.
- **Sales has the highest department attrition (20.6%),** against 13.9% in Research & Development; Sales Representatives are highest at 39.8%.
- **New joiners leave most:** 34.9% attrition in the first 0-1 years, falling to 10.4% after 10 years.
- **Low pay and young age raise risk:** 28.7% attrition in the low income band, and 27.9% for employees under 30.
- **Action needed:** 69 employees work overtime and have 0-1 years of service; 55.1% of them left, and 31 are still employed and should be prioritised for retention.

Note: figures are calculated from Human_Resources.csv before cleaning the blank cells (13 blanks in 10 columns), so small differences are possible after cleaning. The dataset is fictional (IBM) and has no dates, so predictive analysis here is a risk estimate from past patterns, not a time forecast.
